

Improving Bladder Control Stars Improvement Program

Program Overview

CMS evaluates and rates the percentage of plan members over the age of 65 that discuss urine leakage problems with their providers. Our team is specially trained to help increase your percentage and improve your star rating.

Why myMTMcare?

As telephonic caregivers, our pharmacists can address potential urinary incontinence issues with your patients. Our pharmacists can educate patients about options, encourage them to seek treatment when needed, and provide valuable support on a sensitive topic. Our pharmacists can engage patients in conversations either during comprehensive medication reviews or through targeted outreach.

Approximately 13 million Americans experience urinary incontinence, which can impair physical, psychological, and social well-being. Adults who experience UI report worse physical health, mental health and quality of life.

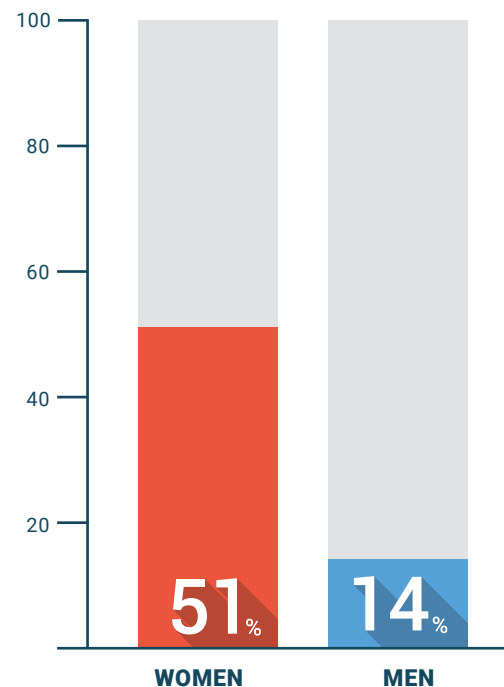

On average, nearly 51% of women and 14% of men experience urinary incontinence.

What can we do?

- Inquire if patients over age 65 have had any incidence of urine leakage, or if they have been counseled/treated for urinary incontinence.
- Notifying provider of these issues for further discussion.

AMOUNT OF PEOPLE WHO EXPERIENCE UI BETWEEN GENDERS
