

Breast Cancer Screening Stars Improvement Program

Why myMTMcare?

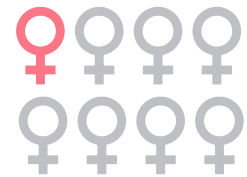

CMS evaluates and rates the percentage of female plan members aged 50-74 who had a mammogram during the past two years. To increase your percentage, we can counsel patients in conjunction with other SIP programs or individually based on your population needs.

We know that preventative health is an important part of healthcare and are committed to educating and engaging women on the importance of these screenings.

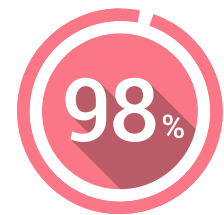

What can we do?

- Inquire when (or if) female patients ages 50-74 years old have had a mammogram and address the possible barriers to receiving this service.
- Address any questions and concerns related to medication use and cancer prevention.
- Encourage patients to have an annual wellness visit.
- Confirm patient is currently being seen by a primary care provider and taking all medications as directed.

Establishing themselves as a caring member of the patient's health care team, our pharmacists know how to address the need for a mammogram with facts and sensitivity. Where needed, our pharmacists will also follow up with the provider to make sure the patient has received the mammogram.

1 in 8 women in the united states will develop breast cancer in their lifetime

If detected in the earliest stages, the five-year survival rate for breast cancer **is 98%**

There are over

3.5 million

breast cancer survivors in the United States.
