

Statin Use in Persons with Diabetes Stars Improvement Program

Why myMTMcare?

Our clinical pharmacists are trained to identify treatment barriers and work through them. By leveraging the clinical depth and expertise of myMTMcare pharmacists, we can improve treatment rates overall for your population.

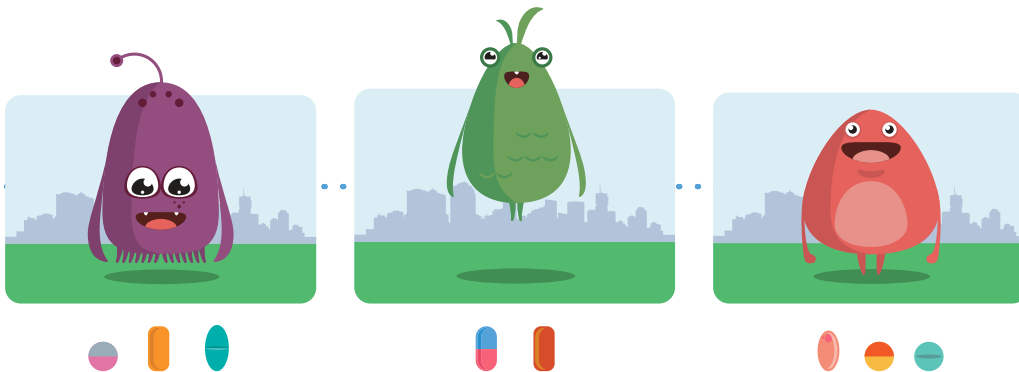

We will connect our skilled pharmacists with the patients who you've identified as a candidate for statin treatment. By working with each patient, we can identify and work through any barriers to receiving statin therapy and, barring any contraindication, can help your patients understand the benefits to statin therapy.

Through high-quality connections and specialized counseling, myMTMcare will be your partner in helping your members to improve medication use for quality outcomes.

Our personalized approach to remote care and outreach can improve statin use for your diabetes patients and improve your plan's Star Ratings

Lack of treatment is often due to multiple factors such as cost, side effect management, provider oversight, and health literacy.

Our pharmacists can contact the pharmacy and/or prescriber, where appropriate, to facilitate prescribing of the statin.
